INTERPRETATION:				
significant. However	in symptomatic patients, a sma	aller number of ba	acteria (100 to 10000/mL) n	n sample of urine is considered clinically nay signify infection. rapubic aspiration or "in-and-out"
catheterization or fro	om patients with indwelling cath	eters.	specimen obtained by sup	ו משמטות מצעורמנוטוו טר ווו-מווע-טענ
1. A test interpreted	as <b>SENSTITIVE</b> implies that infect			ted with the dosage of an antimicrobial agent

recommended for that type of infection and infecting species, unless otherwise indicated.. 2. A test interpreted as **INTERMEDIATE** implies that the" Infection due to the isolate may be appropriately treated in body sites where the drugs are physiologically concentrated or when a high dosage of drug can be used". 3.A test interpreted as **RESISTANT** implies that the "isolates are not inhibited by the usually achievable concentration of the agents with normal

dosage, schedule and/or fall in the range where specific microbial resistance mechanism are likely (e.g. beta-lactamases), and clinical efficacy has not been reliable in treatment studies.

## CAUTION:

Conditions which can cause a false Negative culture: 1. Patient is on antibiotics. Please repeat culture post therapy.

2. Anaerobic bacterial infection.

- 3. Fastidious aerobic bacteria which are not able to grow on routine culture media.
- 4. Besides all these factors, at least in 25-40 % of cases there is no direct correlation between in vivo clinical picture.

5. Renal tuberculosis to be confirmed by AFB studies.
