

TEST PERFORMED AT KOS DIAGNOSTIC LAB, AMBALA CANTT.

NAME       : Mr. PARDEEP         AGE/ GENDER       : 36 YRS/MALE       PATIENT ID       : 1544351         COLLECTED BY       :       REG. NO./LAB NO.       : 012407100045         REFERRED BY       :       REGISTRATION DATE       : 10/Jul/2024 12:24 PM         BARCODE NO.       : 01512873       COLLECTION DATE       : 10/Jul/2024 12:27PM         CLIENT CODE.       : KOS DIAGNOSTIC LAB       REPORTING DATE       : 10/Jul/2024 01:33PM         CLIENT ADDRESS       : 6349/1, NICHOLSON ROAD, AMBALA CANTT       Test Name       Value       Unit       Biological Reference i         HAEIMATOLOGY         ERYTHROCYTE SEDIMENTATION RATE (ESR)         by MODIFIED WESTERGREN AUTOMATED METHOD       4       mm/1st hr       0 - 20         INTERPRETATION:         1. ESR is a non-specific test because an elevated result often indicates the presence of inflammation associated with infection, cance immune disease, but does not tell the health practitioner exactly where the inflammation is in the body or what is causing it.       2. An ESR can be affected by other conditions besides inflammation. For this reason, the ESR is typically used in conjunction with oth as C-reactive protein         3. This test may also be used to monitor disease activity and response to therapy in both of the above diseases as well as some othe systemic lupus erythematosus	Dr. Yugam Chopra MD (Pathology) CEO & Consultant Pathologist

<ol> <li>ESR is a non-specific test because an elevated result often indicates the presence of inflammation associated with infection, cancel immune disease, but does not tell the health practitioner exactly where the inflammation is in the body or what is causing it.</li> <li>An ESR can be affected by other conditions besides inflammation. For this reason, the ESR is typically used in conjunction with oth as C-reactive protein</li> <li>This test may also be used to monitor disease activity and response to therapy in both of the above diseases as well as some other</li> </ol>		
<ul> <li>A low ESR can be seen with conditions that inhibit the normal sedimentation of red blood cells, such as a high red blood cell count (polycythaemia), significantly high white blood cell count (leucocytosis), and some protein abnormalities. Some changes in red cell as sickle cells in sickle cell anaemia) also lower the ESR.</li> <li>NOTE:</li> <li>1. ESR and C - reactive protein (C-RP) are both markers of inflammation.</li> <li>2. Generally, ESR does not change as rapidly as does CRP, either at the start of inflammation or as it resolves.</li> <li>3. CRP is not affected by as many other factors as is ESR, making it a better marker of inflammation.</li> <li>4. If the ESR is elevated, it is typically a result of two types of proteins, globulins or fibrinogen.</li> <li>5. Women tend to have a higher ESR, and menstruation and pregnancy can cause temporary elevations.</li> <li>6. Drugs such as dextran, methyldopa, oral contraceptives, penicillamine procainamide, theophylline, and vitamin A can increase ES aspirin, cortisone, and quinine may decrease it</li> </ul>
