SPINA BIFIDA/ANENCEPHALY SCREENING RISK *by CLIA (CHEMILUMINESCENCE IMMUNOASSAY)*	< 1:10000 NEGATIVE (-ve)		RISK CUT OFF 1:50

INTERPRETATION:

1.Multiple marker serum has become standard tool used in obstetrica care to identify pregnancies that may have increased risk for certain birth defects such as NEURALTUBE DEFECTS (NTD'S), DOWN'S SYNDROME (TRISOMY 21) AND TRISOMY 18. The screen is performed by measuring analytes in maternal serum that are produced by the fetus and the placenta. The analytes values along with maternal demographic information such as age, weight , gestational age, diabetic status, and race are used together in mathematical model to derive risk estimate.
2.The laboratory establishes a specific cut off for each condition, which classifies each screen as either screen-positive or screen-negative.
3.A screen-positive result indicates that the value obtained exceeds the established cut off.

Test Name	Value	Unit	Biological Reference interval

4.The estimated risk calculation and screen results are dependant on accurate information for gestation, maternal age, race, IDD, and weight.Inaccurate information can lead to significant alterations in the estimated risk. In particular, erroneous assessment of gestational age can result in false-positive or false-negative screen results. Because of its increased accuracy, we therefore recommend determination of gestational age by ultrasound, rather than by last menstural period (LMP), When possible.

4.A negative screen indicates a lower probability of having a baby with TRISOMY 21 ,TRISOMY 18 and NEURAL TUBE DEFECTS, but does not completely exclude the possibility.
5.A positive screen on the contrary only indicates a higher probability of having a baby with TRISOMY 21, TRISOMY 18 and NEURAL TUBE DEFECTS, and needs confirmation by cytogenetic studies and/or level II scan.

NOTE:

1.Triplet and higher multiple pregnancies cannot be interpreted

2.The reportable range for Trisomy 21, Trisomy 18 and NTD : >1:50 to < 1:10000

3.TRISOMY 21: HIGH RISK: >1:50 - 1:250

4.TRISOMY 18: HIGH RISK: >1:50 - 1:100

5.NEURAL TUBE DEFECT (NTD'S): HIGH RISK: >1:50

6.Biological markers evaluated in this test have marked as H(HIGH) or L(LOW) since there is wide variation in Alpha Fetoprotein, HCG and Unconjugated Estriol ranges depending upon gestational age. "In Range" and "Out of Range" columns are not applicable for the parameters appearing in Multiple of Median (MoM) and Risk calcultion.

7.Individually, Alpha Fetoprotein or HCG or unconjugated Estriol levels do not correlate with risk assessment of Trisomy 18, Trisomy 21 or Neural Tube Defects

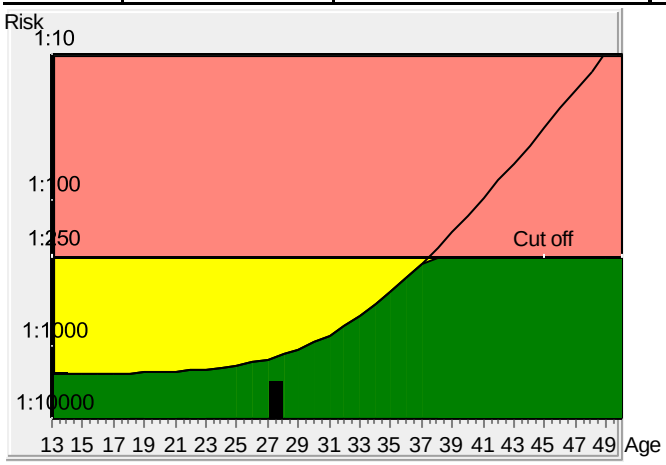
Inh-A	138.6	pg/ml	1.08	Corr. MoM		



Tr.21 risk
at term
1:4205

Age risk
at term
1:1208

Down's Syndrome Risk

The calculated risk for Trisomy 21 is below the cut off which represents a low risk.
After the result of the Trisomy 21 test it is expected that among 4205 women with the same data, there is one woman with a trisomy 21 pregnancy and 4204 women with not affected pregnancies.
The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician.
Please note that risk calculations are statistical approaches and have no diagnostic value!

Neural tube defects risk

The corrected MoM AFP (0.87) is located in the low risk area for neural tube defects.

Risk for trisomy 18

The calculated risk for trisomy 18 is < 1:10000, which indicates a low risk.

below cut off | Below Cut Off, but above Age Risk | above cut off
