

Dr. Vinay Chopra MD (Pathology & Microbiology) Chairman & Consultant Pathologist		1icrobiology)	Dr. Yugam Chopra MD (Pathology) CEO & Consultant Pathologist	
NAME	: Mrs. VIBHA			
AGE/ GENDER	: 36 YRS/FEMALE	PATIE	NT ID	: 1584024
COLLECTED BY	:	REG. NO./LAB NO.		: 012408180035
REFERRED BY	:	REGIST	FRATION DATE	: 18/Aug/2024 09:47 AM
BARCODE NO.	: 01515247	COLLE	CTION DATE	: 18/Aug/2024 09:50AM
CLIENT CODE.	: KOS DIAGNOSTIC LAB	REPOR	TING DATE	: 18/Aug/2024 11:48AM
CLIENT ADDRESS	: 6349/1, NICHOLSON ROAD, A	MBALA CANTT		
Test Name		Value	Unit	Biological Reference interval
		ENDOCRINO	_OGY	
		ESTRADIOL ((E2)	
ESTRADIOL (E2): SER by CMIA (CHEMILUMIN	UM ESCENT MICROPARTICLE IMMUNOASS	396 (AY)	pg/mL	FEMALE FOLLICULAR PHASE: 19.5 144.2 FEMALE MID CYCLE PHASE: 63.9 - 356.7 FEMALE PRE OVULATORY PHASE:
				136.0 - 251.0 FEMALE LUTEAL PHASE: 55.8 - 214.2 POST MENOPAUSAL:< 50.0

OTHER MATERNAL FACTORS AND PREGNANCY	UNITS	RANGE
Hormonal Contraceptives	pg/mL	15.0 – 95.0
1st Trimester (0 – 12 Weeks)	pg/mL	38.0 - 3175.0
2nd Trimester (13 – 28 Weeks)	pg/mL	678.0 - 16633.0
3rd Trimester (29 – 40 Weeks)	pg/mL	43.0 - 33781.0
Post Menopausal	Pg/mL	< 50.0
MALES:	pg/mL	< 40.0

1. Estrogens are involved in development and maintenance of the female phenotype,germ cell maturation,and pregnancy. They also are important for many other, nongender-specific processes, including growth, nervous system maturation, bone metabolism/remodeling, and endothelial responsiveness.

2. E2 is produced primarily in ovaries and testes by aromatization of testosterone.

3. Small amounts are produced in the adrenal glands and some peripheral tissues, most notably fat.E2 levels in premenopausal women fluctuate during the menstrual cycle.

4. They are lowest during the early follicular phase. E2 levels then rise gradually until 2 to 3 days before ovulation, at which stage they start to increase much more rapidly and peak just before the ovulation-inducing luteinizing hormone (LH)/follicle stimulating hormone (FSH) surge at 5 to 10 times the early follicular levels. This is followed by a modest decline during the ovulatory phase. E2 levels then increase again gradually until the midpoint of the luteal phase and thereafter decline to trough, early follicular levels.

INDICATIONS FOR ASSAY: -

- 1. Evaluation of hypogonadism and oligo-amenorrhea in females.
- 2. Assessing ovarian status, including follicle development, for assisted reproduction protocols (eg, in vitro fertilization)
- 3. In conjunction with lutenizing hormone measurements, monitoring of estrogen replacement therapy in hypogonadal premenopausal women 4. Evaluation of feminization, including gynecomastia, in males.
- 5. Diagnosis of estrogen-producing neoplasms in males, and, to a lesser degree, females

	Dr. Yugam	Chopra

6. As part of the diagnosis and work-up of precocious and delayed puberty in females, and, to a lesser degree, males

7. As part of the diagnosis and work-up of suspected disorders of sex steroid metabolism, eg: aromatase deficiency and 17 alpha-hydroxylase deficiency

8. As an adjunct to clinical assessment, imaging studies and bone mineral density measurement in the fracture risk assessment of postmenopausal women, and, to a lesser degree, older men

9. Monitoring low-dose female hormone replacement therapy in post-menopausal women

10. Monitoring antiestrogen therapy (eg, aromatase inhibitor therapy).

CAUSES FOR INCREASED E2 LEVELS:

1. High androgen levels caused by tumors or androgen therapy (medical or sport performance enhancing), with secondary elevations in E1 and E2 due to aromatization

2. Obesity with increased tissue production of E1

3. Decreased E1 and E2 clearance in liver disease

4. Estrogen producing tumors

5. Estrogen Ingestion
