

TEST PERFORMED AT KOS DIAGNOSTIC LAB, AMBALA CANTT.

Dr. Vinay Chopra MD (Pathology & Microbiology) Chairman & Consultant Pathologist		MD	Dr. Yugam Chopra MD (Pathology) CEO & Consultant Pathologist	
NAME	: Master. AHAAN			
AGE/ GENDER	: 3 YRS/MALE	PATIENT ID	: 1643708	
COLLECTED BY	:	REG. NO./LAB NO.	: 012410150025	
REFERRED BY	:	REGISTRATION DATE	: 15/Oct/2024 10:00 AM	
BARCODE NO.	: 01518929	COLLECTION DATE	: 15/Oct/2024 10:47AM	
CLIENT CODE.	: KOS DIAGNOSTIC LAB	REPORTING DATE	: 15/Oct/2024 12:05PM	
CLIENT ADDRESS	: 6349/1, NICHOLSON ROAD, AMBALA CANT	Г		
Test Name	Value	Unit	Biological Reference interval	
IMMUNOPATHOLOGY/SEROLOGY IMMUNOGLOBIN IgE				
immunoglobin-e (IgE): SERUM 598.33 ^H	IU/mL	0.00 - 60.0	
INTERPRETATION: COMMENTS: 1.1gE antibodies mediate allergic diseases by sensitizing mast cells and basophils to release histamine and other inflammatory mediators on exposure to allergens. 2. Total IgE is represents the sum of all the specific IgE, which inturn includes many groups of specific IgE & allergen specific IgE is just one such group amongst them. 3. Total IgE determination constitutes a screening method of atopic diseases, although within range values of total IgE do not exclude the existence of atopy and high values of total IgE are not pathognomonic of atopy by themselves. 4. Antigen-specific IgE is the next step in the in vitro identification of the responsible allergen. There are more than 400 characterized known allergens available for in vitro diagnostic tests and testing to be selected based on symptoms, clinical & environmental details. 5. In adults, Total IgE values between 100 to 1000 Ul/ml may not correlate with allergic no file, where the patients may be just sensitized to different allergen or often the cause for high IgE could be non-atopic. 6. Specific IgE results obtained with the different methods vary significantly, hence followup testing to be performed using one laboratory only. 7. The probability of finding an increased level of IgE in serum in a patient with allergic disease varies directly with the number of different allergens and limited end organ involvement. INCREASED: 1. Atopic/Non Atopic Allergy 2. Parasitic Infection. 3. IgE Myeloma 4. Allergic bronchopulmonary aspergillosis. <				
 To confirm clinical expression of sensitivity to foods in patients with Anaphylactic sensitivity or with Asthma, Angioedema or Cutaneous disease To evaluate sensitivity to insect venom allergens particularly as an aid in defining venom specificity in those cases in which skin tests are 				
equivocal 5.To confirm the presence of IgE antibodies to certain occupational allergens				
*** End Of Report ***				
District and the second
