CLIENT CODE.	: KOS DIAGNOSTIC LAB	REPO	RTING DATE	: 16/Oct/2024 03:30PM
CLIENT ADDRESS	: 6349/1, NICHOLSON ROAD, AM	MBALA CANTT		
Test Name		Value	Unit	Biological Reference interval
	FOLLIC		HORMONE (FSH)	
	NG HORMONE (FSH): SERUM ESCENCE IMMUNOASSAY)	3.26	mIU/mL	FEMALE FOLLICULAR PHASE: 3.03 8.08 FEMALE MID-CYCLE PEAK: 2.55 - 16.69 FEAMLE LUTEAL PHASE: 1.38 - 5.47 FEMALE POST-MENOPAUSAL: 26.72 - 133.41 MALE: 0.95 - 11.95

Condotropin-releasing hormone from the hypothalamus controls the secretion of the gonadotropins, follicle-stimulating hormone (FSH) and luteinizing hormone (LH) from the anterior pituitary.
 The menstrual cycle is divided by a midcycle surge of both FSH and LH into a follicular phase and a luteal phase.

3. FSH appears to control gametogenesis in both males and females. The test is useful in the following settings:

An adjunct in the evaluation of menstrual irregularities.
 Evaluating patients with suspected hypogonadism.
 Predicting ovulation

4. Evaluating infertility

5. Diagnosing pituitary disorders

6. In both males and females, primary hypogonadism results in an elevation of basal follicle-stimulating hormone (FSH) and luteinizing hormone (LH) levels

#### FSH and LH LEVELS ELEVATED IN:

1. Primary gonadal failure

2. Complete testicular feminization syndrome.

3. Precocious puberty (either idiopathic or secondary to a central nervous system lesion)

- 4. Menopause (postmenopausal FSH levels are generally >40 IU/L) 5. Primary ovarian hypofunction in females
- 6. Primary hypogonadism in males
- NOTE:
- 1. Normal or decreased FSH is seen in polycystic ovarian disease in females
- 2. FSH and LH are both decreased in failure of the pituitary or hypothalamus.

CLIENT CODE.	: KOS DIAGNOSTIC LAB		<b>REPORTING DATE</b>	: 16/Oct/2024 04:06PM	
CLIENT ADDRESS	: 6349/1, NICHOLSON ROAD, AM	BALA CANTT			
Test Name		Value	Unit	Biological Reference interval	
	ANTI MU	JLLERIAN H	IORMONE (AMH) GEN	II	
	ORMONE (AMH) GEN II: SERUM HEMILUMINESCENCE IMMUNOASSAY)	4.202	ng/mL	0.05 - 11.00	
A Correlation of FER	TILITY POTENTIAL and AMH levels are	e:			
C	OVARIAN FERTILITY POTENTIAL		AMH VALU	IES IN (ng/mL)	
	OPTIMAL FERTILITY:		4.00 – 6.80 ng/	/mL	
SATISFACTORY FERTILITY:			2.20 – 4.00 ng/mL		

 LOW FERTILITY:
 0.30 – 2.20 ng/mL

 VERY LOW/UNDETECTABLE:
 0.00 – 0.30 ng/mL

 HIGH LEVEL:
 >6.8 ng/mL (PCOD/GRANULOSA CELL TUMOUR)

Anti Mullerian Hormone (AMH) is also known as Mullerian Inhibiting Substance provided by sertoli cells of the testis in males and by ovarian granulose cells in females upto antral stage in females.

#### IN MALES:

1. It is used to evaluate testicular presence and function in infants with intersex conditions or ambiguous genitalia, and to distinguish between cryptorchidism and anorchia in males

## IN FEMALES:

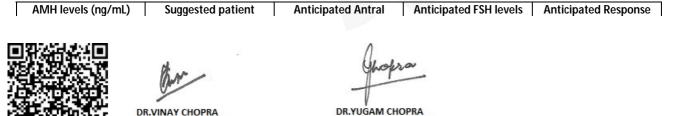

1. During reproductive age, follicular AMH productionbegins during the primary stage, peaks in preantral stage & has influence on follicular sensitivity to FSH which is impoetant in selection for follicular dominance. AMH levels thus represents the pool or number of primordial follicles but not thequality of oocytes. AMH does not vary significantly during menstrual cycle & hence can be measured independently of day of cycle. 2. Polycystic ovarian syndrome can elevate AMH 2 to 5 fold higher than age specific reference range & predict anovulatory, irregular cycles, ovarian tumours like Granulosa cell tumour are often associated with higher AMH levels.

3.Obese women are often associated with diminished ovarian reserve and can have 65% lower mean AMH levels than non-obese women. 4.In females , AMH levels do not change significantly throughout the menstrual cycle and decrease with age.

5.Assess Ovarian Reserve - correlates with the number of antral follicies in the ovaries.

6.Evaluate fertility potential and ovarian response in IVF- Women with low AMG levels are more likely to the poor ovarian responders. 7.Assess the condition of Polycystic Ovary and premature ovarian failure.

A combination of Age, Ultrasound markers-Ovarian Volume and Antral Follicle Count, AMH and FSH levels are useful for optimal assessment of ovarian reserve. Studies in various fertility clinics are ongoing to establish optimal AMH concentretaion for predicting response to invitro fertilization, however, given below is suggested interpretative reference.

CLIENT CODE.	: KOS DIAGNOSTIC LAB	<b>REPORTING DATE</b>	: 16/Oct/2024 04:06PM	
CLIENT ADDRESS	: 6349/1, NICHOLSON ROAD, AMBALA CANT	Г		

Test Name	Value		Unit	Biological Reference interval	
	Categorization for fertility based on AMH for age group (20 to 45 yrs)	Follicle counts	(day 3)	to IVF/COH cycle	
Below 0.3	Very low	Below 4	Above 20	Negligible/Poor	
0.3 to 2.19	Low	4 - 10	Usually 16 - 20	Reduced	
2.19 t0 4.00	Satisfactory	11 - 25	Within reference range or between 11 - 15	Safe/Normal	
Above 4.00	Optimal	Upto 30 and Above	Within reference range or between 11 – 15 or Above 15	Possibly Excessive	

## INCREASED:

1.Polycystic ovarian syndrome (most common)

2. Ovarian Tumour: Granulosa cell tumour

#### DECREASED:

1. Anorchia, Abnormal or absence of testis in males

2.Pseudohermaphroditism

3.Post Menopause

## NOTE:

1.AMH measurement alone is seldom suffcient for diagnosis and results should be interpreted in the light of clinical finding and other relevant test such as ovarian ultrasonography(In fertility applications); abdominal or testicular ultrasound(intersex or testicular function applications); measurement of sex steroids (estradiol,Progesterone,Testosterone),FSH, Inhibin B (For fertility), and Inhibin A and B (for tumour work up). 2.Conversion of AMH grom ng/mL to pmol/L can be performed by using equation 1 ng/mL = 7.14 pmol/L
