NAME	: Mrs. SHWETA		
AGE/ GENDER	: 40 YRS/FEMALE	PATIENT ID	: 1636573
COLLECTED BY	:	REG. NO./LAB NO.	: 012411050059
REFERRED BY	:	REGISTRATION DATE	: 05/Nov/2024 12:25 PM
BARCODE NO.	: 01520155	COLLECTION DATE	: 05/Nov/2024 12:27PM
CLIENT CODE.	: KOS DIAGNOSTIC LAB	REPORTING DATE	: 05/Nov/2024 02:33PM
CLIENT ADDRESS	: 6349/1, NICHOLSON ROAD, AMBALA CANTT		
Test Name	Value	Unit	Biological Reference interval
ENDOCRINOLOGY PROLACTIN			
PROLACTIN: SERUM		ng/mL	3 - 25
by CMIA (CHEMILUMINE INTERPRETATION:	ESCENT MICROPARTICLE IMMUNOASSAY)		
 The major chemical controlling prolactin secretion is dopamine, which inhibits prolactin secretion from the pituitary. Physiological function of prolactin is the stimulation of milk production. In normal individuals, the prolactin level rises in response to physiologic stimuli such as sleep, exercise, nipple stimulation, sexual intercourse, hypoglycemia, postpartum period, and also is elevated in the newborn infant. INCREASED (HYPERPROLACTEMIA): Prolactin-secreting pituitary adenoma (prolactinoma, which is 5 times more frequent in females than males). Functional and organic disease of the hypothalamus. Primary hypothyroidism. Section compression of the pituitary stalk. Chest wall lesions and renal failure. Ectopic tumors. TDBUGS: Anti-Dopaminergic drugs like antipsychotic drugs, antinausea/antiemetic drugs, Drugs that affect CNS serotonin metabolism, serotonin receptors, or serotonin reuptake (anti-depressants of all classes, ergot derivatives, some illegal drugs such as cannabis), Antihypertensive drugs (Opiates, High doses of estrogen or progesterone, anticonvulsants (valporic acid), anti-tuberculous medications (Isoniazid). SIGNIFICANCE: In nolss, prolactin levels >17 ng/mL are indicative of hyperprolactinemia. In noss, prolactin levels >27 ng/mL in the absence of pregnancy and postpartum prolactin levels >27 ng/mL in the absence of pregnancy and postpartum lactation are indicative of hyperprolactinemia. In women, prolactin levels >27 ng/mL in the absence of pregnancy and postpartum lactation are indicative of hyperprolactinemia. In women, spreasent, 5. Whereas levels >250 ng/mL are usually associated with a prolactin bound to immunoglobulin). Macroprolactin should be evaluat
