## IMMUNOPATHOLOGY/SEROLOGY

### VDRL TITRES

**VDRL**  
 by IMMUNOCHROMATOGRAPHY  
 END POINT TITRES  
 by IMMUNOCHROMATOGRAPHY

**REACTIVE**

**NON REACTIVE**

1:16 (DILUTION )

#### INTERPRETATION:

#### NOTE:

Titres of 1:8 and above are considered significant

#### COMMENTS:

- 1.This is a screening test for syphilis which is useful for following the progression of disease and response to therapy. Rising titers are of immense value in confirming the diagnosis.
- 2.Reactive results must be correlated with supporting clinical, historical and epidemiological evidence to arrive at a final diagnosis.
- 3.Biological false positive reactions exhibit low titers and are seen in conditions like Viral and Bacterial infections, Mycoplasma infection, Chlamydia infection, Malaria, Immunizations, Pregnancy, Autoimmune disorders & past history of Treponemal infection.
- 3.Subsequent testing of sera by one of specific treponemal antigen such as TPHA & FTA-ABS is recommended in these cases
