	THYROID FUNC	TION TEST: TOTAL			
TRIIODOTHYRONINE (T3): SERUM 1.12 by CMIA (CHEMILUMINESCENT MICROPARTICLE IMMUNOASSAY)		ng/mL	0.35 - 1.93		
THYROXINE (T4): SERUM 7.97 by CMIA (CHEMILUMINESCENT MICROPARTICLE IMMUNOASSAY)		µgm/dL	4.87 - 12.60		
THYROID STIMULA	TING HORMONE (TSH): SERUM 1.25 ESCENT MICROPARTICLE IMMUNOASSAY)	µIU/mL	0.35 - 5.50		

CLINICAL CONDITION	T3	T4	TSH	
Primary Hypothyroidism:	Reduced	Reduced	Increased (Significantly)	
Subclinical Hypothyroidism:	Normal or Low Normal	Normal or Low Normal	High	
Primary Hyperthyroidism:	Increased	Increased	Reduced (at times undetectable)	
Subclinical Hyperthyroidism:	Normal or High Normal	Normal or High Normal	Reduced	

LIMITATIONS:-

1. T3 and T4 circulates in reversibly bound form with Thyroid binding globulins (TBG), and to a lesser extent albumin and Thyroid binding Pre Albumin so conditions in which TBG and protein levels alter such as pregnancy, excess estrogens, androgens, anabolic steroids and glucocorticoids may falsely affect the T3 and T4 levels and may cause false thyroid values for thyroid function tests.

2. Normal levels of T4 can also be seen in Hyperthyroid patients with :T3 Thyrotoxicosis, Decreased binding capacity due to hypoproteinemia or ingestion of certain drugs (e.g.: phenytoin , salicylates).

3. Serum T4 levels in neonates and infants are higher than values in the normal adult , due to the increased concentration of TBG in neonate serum.

4. TSH may be normal in central hypothyroidism , recent rapid correction of hyperthyroidism or hypothyroidism , pregnancy , phenytoin therapy.
