CLIENT ADDRESS	: 6349/1, NICHOLSON ROAD), AMBALA CANTT		
Test Name		Value	Unit	Biological Reference interval
	II	/IMUNOPATHOLO)GY/SEROLOGY	
	ANTI HUMAN IMMUNOE	DEFICIENCY VIRUS (H	HIV) ANTIBODIES H	HIV (1 & 2) SCREENING
HIV 1/2 AND P24 AN		NON - REACTIV	VE	
	t least 2 known types of HIV vir ed immuno-chromatographic so routine serologic screening of	olid phase ELISA assay d	etects antibodies agai	inst both HIV-1 and HIV-2 viruses.

NOTE:-

1. Confirmatory testing by Western blot is recommended for patients who are reactive for HIV by this assay.

2.Antibodies against HIV-1 and HIV-2 are usually not detectable until 6 to 12 weeks following exposure (window period) and are almost always detectable by 12 months.

3. The test is not recommended for children born to HIV infected mothers till the child turns two years old (as HIV antibodies may be transmitted passively to the child trans-placentally).

FALSE NEGATIVE RESULT SEEN IN:

1. Window period

2.Severe immuno-suppression including advanced AIDS.

HEPATITIS B SURFACE ANTIGEN (HBSAG, RESULT ION REACTIVE

by IMMUNOCHROMATOGRAPHY

INTERPRETATION:-

1.HBsAG is the first serological marker of HBV infection to appear in the blood (approximately 30-60 days after infection and prior to the onset of clinical disease). It is also the last viral protein to disappear from blood and usually disappears by three months after infection in self limiting acute Hepatitis B viral infection.

2.Persistence of HBsAg in blood for more than six months implies chronic infection. It is the most common marker used for diagnosis of an acute Hepatitis B infection but has very limited role in assessing patients suffering from chronic hepatitis.

FALSE NEGATIVE RESULT SEEN IN:

1.Window period.

2. Infection with HBsAg mutant strains

3. Hepatitis B Surface antigen (HBsAg) is the earliest indicator of HBV infection. Usually it appears in 27 - 41 days (as early as 14 days). 4. Appears 7 - 26 days before biochemical abnormalities. Peaks as ALT rises. Persists during the acute illness. Usually disappears 12 - 20 weeks

4. Appears 7 - 26 days before biochemical abnormalities. Peaks as ALT rises. Persists during the acute liness. Ostally disappears 12- 20 weeks after the onset of symptoms / laboratory abnormalities in 90% of cases.

5.Is the most reliable serologic marker of HBV infection. Persistence > 6 months defines carrier state. May also be found in chronic infection. Hepatitis B vaccination does not cause a positive HBsAg. Titers are not of clinical value.

NOTE:-

1.All reactive HBsAG Should be reconfirmed with neutralization test(HBsAg confirmatory test).

2.Anti - HAV IgM appears at the same time as symptoms in > 99% of cases, peaks within the first month, becomes nondetectable in 12 months (usually 6 months). Presence confirms diagnosis of recent acute infection.
