	INTERPRETATION				DIABETIC: $> 0R = 200.0$
IN ACCORDANCE WITH AMERICAN DIABETES ASSOCIATION GUIDELINES:					
1. A random plasma glucose level below 140 mg/dl is considered normal.	2. A random glucose (after consumption o	level between 140 - 200 mg/dl f 75 gms of glucose) is recomm	is considered as glue ended for all such pa	cose intolerant or prediat	petic. A fasting and post-prnadial blood te

(after consumption of 75 gms of glucose) is recommended for all such patients. 3. A random glucose level of above 200 mg/dl is highly suggestive of diabetic state. A repeat post-prandial is strongly recommended for all such patients. A fasting plasma glucose level in excess of 125 mg/dl on both occasions is confirmatory for diabetic state.

Test Name		Value	Unit	Biological Reference interval
	I	MMUNOPATHOLO	GY/SEROLOGY	
		WIDAL SLIDE AGGLU	TINATION TEST	
SALMONELLA TYPHI	0	1 : 80	TINATION TEST TITRE	1 : 80
SALMONELLA TYPHI by slide agglutina SALMONELLA TYPHI by slide agglutina	rion H			1 : 80 1 : 160
by SLIDE AGGLUTINA	TION H TION	1 : 80	TITRE	

INTERPRETATION:

1. Titres of 1:80 or more for "O" agglutinin is considered significant.

2. Titres of 1:160 or more for "H" agglutinin is considered significant.

LIMITATIONS:

TEST PERFORMED AT KOS DIAGNOSTIC LAB. AMBALA CANTI

1.Agglutinins usually appear by 5th to 6th day of illness of enteric fever, hence a negative result in early stage is inconclusive. The titre then rises till 3rd or 4th week, after which it declines gradually.

2.Lower titres may be found in normal individuals.

3.A single positive result has less significance than the rising agglutination titre, since demonstration of rising titre four or more in 1st and 3rd week is considered as a definite evidence of infection.

4.A simultaneous rise in H agglutinins is suggestive of paratyphoid infection.

NOTE:

1. Individuals with prior infection or immunization with TAB vaccine may develop an ANAMNESTIC RESPONSE (False-Positive) during an unrelated fever i.e High titres of antibodies to various antigens. This may be differentiated by repitition of the test after a week.

2. The anamnestic response shows only a transient rise, while in enteric fever rise is sustained.

3.H agglutinins tend to persist for many months after vaccination but O agglutinins tend to disappear sooner i.e within 6 months. Therefore rise in Oagglutinins indicate recent infection.
