1:4 (DILUTION)

by IMMUNOCHROMATOGRAPHY

#### INTERPRETATION:

- 1.Syphilis is a chronic infection that progresses through distinct stages namely Primary, Secondary, Tertiary & Quarternary producing diverse clinical symptoms.
- 2.The infection is caused by the Spirochaete Treponema acquired usually by sexual contact although the disease may be transmitted through blood transfusion and intra-uterine infection.
3. Positive results indicate both past or present infections.
- 4.False positive results are seen in patients suffering from Leprosy, Infectious mononucleosis and Connective tissue disorders.
- 5.This test does not distinguish between Syphilis and other pathogenic treponemal infections.
- 6.All positive results should be confirmed with FTA-ABS ( Fluorescent Treponemal Antibodies) test.
