CLIENT ADDRESS	<b>RESS</b> : NASIRPUR, HISSAR ROAD, AMBALA CITY - HARYANA						
Test Name		Value	Unit	Biological Reference interval			
	CLINICA		Y/BIOCHEMIS	STRY			
		CALCI	JM				
CALCIUM: SERUM by ARSENAZO III, SPE		10.14	mg/dL	8.50 - 10.60			
INTERPRETATION:-							
	tal) estimation is used for the diagr r gastrointestinal tract.	nosis and monitoring	of a wide range of dis	sorders including diseases of bone, kidney,			
	y also reflect abnormal vitamin D o	or protein levels.					
				9% is present as calcium hydroxyapatite in bo			
	n the extra-osseous intracellular sp is bound to a considerable extent t			the form of inorganic complexes, and 50% is			
present as free or ior	nized calcium.		<b>3</b>	с .			
	affect the contractility of the heart ns play an important role in blood			ential for the function of the nervous system.			
addition, calcium for	is play an important role in blood	ciotting and bone mi					
	N CALCIUM LEVELS) CAUSES :-						
	e or impaired function of the parati			esis. n-D synthesis as well as hyperphosphatemia			
	ce to the action of parathyroid hor			synthesis as well as hyperphosphatenna			
3 NOTE - A character	ristic symptom of hypocalcemia is l	atent or manifest tet	any and osteomalacia	a			

3. NOTE:- A characteristic symptom of hypocalcemia is latent or manifest tetany and osteomalacia.

## HYPERCALCEMIA (INCREASE CALCIUM LEVELS) CAUSES:-

1. Increased mobilization of calcium from the skeletal system or increased intestinal absorption.

2. Primary hyperparathyroidism (pHPT)

3.Bone metastasis of carcinoma of the breast, prostate, thyroid gland, or lung

NOTE:-Severe hypercalcemia may result in cardiac arrhythmia.

		TAMINS				
VITAMIN D/25 HYDROXY VITAMIN D3						

VITAMIN D (25-HYDROXY VITAMIN D3): SERUM 22.9<sup>L</sup> ng/mL by CLIA (CHEMILUMINESCENCE IMMUNOASSAY)

DEFICIENCY: < 20.0 INSUFFICIENCY: 20.0 - 30.0 SUFFICIENCY: 30.0 - 100.0 TOXICITY: > 100.0

## INTERPRETATION:

MERINE MAN				
DEFICIENT:	< 20	ng/mL		
INSUFFICIENT:	21 - 29	ng/mL		
PREFFERED RANGE:	30 - 100	ng/mL		
INTOXICATION:	> 100	ng/mL		

1. Vitamin D compounds are derived from dietary ergocalciferol (from plants, Vitamin D2), or cholecalciferol (from animals, Vitamin D3), or by conversion of 7- dihydrocholecalciferol to Vitamin D3 in the skin upon Ultraviolet exposure.

2.25-OH--Vitamin D represents the main body resevoir and transport form of Vitamin D and transport form of Vitamin D, being stored in adipose tissue and tightly bound by a transport protein while in circulation.

3. Vitamin D plays a primary role in the maintenance of calcium homeostatis. It promotes calcium absorption, renal calcium absorption and phosphate reabsorption, skeletal calcium deposition, calcium mobilization, mainly regulated by parathyroid harmone (PTH). 4. Severe deficiency may lead to failure to mineralize newly formed osteoid in bone, resulting in rickets in children and osteomalacia in adults. DECREASED:

1.Lack of sunshine exposure.

2.Inadequate intake, malabsorption (celiac disease) 3.Depressed Hepatic Vitamin D 25- hydroxylase activity

4.Secondary to advanced Liver disease

5. Osteoporosis and Secondary Hyperparathroidism (Mild to Moderate deficiency)

6.Enzyme Inducing drugs: anti-epileptic drugs like phenytoin, phenobarbital and carbamazepine, that increases Vitamin D metabolism.

INCREASED: 1. Hypervitaminosis D is Rare, and is seen only after prolonged exposure to extremely high doses of Vitamin D. When it occurs, it can result in severe hypercalcemia and hyperphophatemia.

CAUTION: Replacement therapy in deficient individuals must be monitored by periodic assessment of Vitamin D levels in order to prevent hypervitaminosis D

NOTE:-Dark coloured individuals as compare to whites, is at higher risk of developing Vitamin D deficiency due to excess of melanin pigment which interefere with Vitamin D absorption.
