Chromosome Analysis Report

Clinical History	No clinical history available.
-------------------------	--------------------------------

Karyotype (ISCN Nomenclature 2020)	46,XY
--	-------

Interpretation	Normal Karyotype
-----------------------	------------------

Banding Method	: GTG	Culture Type	: 72hrs PHA stimulated
Banding Resolution	: Approx 550	Metaphases Counted	: 20
Metaphases Analyzed	: 20	Metaphase Karyotyped	: 05
Proliferative Index	: Good	Quality of Metaphases	: Good

For specimens received from non NCGM locations, it is presumed that it belongs to the patient as identified on the labels of the container/Test Requisition Form and it has been verified as per GCLP (Good Clinical Lab Practices) by the referrer at the time of collection of the specimen. NCGM's responsibility is limited to the analytical part of the assay performed.

Limitation

The error rate of the test is 0.5%. The normal report does not rule out very Low grade mosaicism, minor chromosomal anomalies, and deletion, Duplication or Inversion at very subtle level. The report should be interpreted in accordance with the counselling provided before the test and with the report. A standard G-banded Karyotype usually has a resolution of around 5 Mb.

Disclaimer

Polymorphic variants have not been reported as these variants are not associated with specific disease or phenotype. Cytogenetically visible polymorphic variants include variants involving heterochromatin (variant size), satellite size, pericentric inversions (heterochromatic or euchromatic regions) [e.g., 1qh+/qh-, 9qh+/qh-, 16qh+/qh-, acrocentric p+ or p-, Yqh+/qh-, inv(9)(p11q13), inv(2)(p11.2q13)] and also euchromatic variants (e.g., located on 4p16, 8p23.1, 9p12, 9q13-q21.12, 15q11.2, 16p11.2).
