### Comment:

Hepatitis B Surface antigen (HBsAg) is a distinctive serological marker of acute or chronic hepatitis B infection. HBsAg is the first antigen to appear following infection with hepatitis B virus and is generally detected 1 to 10 weeks before the onset of clinical symptoms. HBsAg assay are routinely used to diagnose suspected HBV infection and to monitor the status of infected individuals to determine whether the infection has resolved or patient has become a chronic carrier to the virus.
